existing high-capacity Rotoform HS model. The significant extra capacity of the new Sandvik Rotoform HS2000 is made possible by the use of a wider depositor and steel belt cooler; instead of the 1500 mm width of the standard RFHS model, a 2000 mm belt is used to boost throughputs from 300 t/d to 400 t/d.

The Rotoform process is simple and efficient.

The molten product is fed into the Rotoform unit (a heated stator and perforated cylinder that rotates around the stator), depositing the melt onto the belt in the form of drops.

that it uses a rotating shell much bigger than the standard Rotoformer. This enables droplets to be deposited onto the steel belt without distortion at twice the previous speeds, typically up to 120 m/min. Combined with a belt that is twice as long - to allow the same cooling time- the system can double production capacity.
