Note, a true MPPT charge controller takes high voltage/low current from the solar array and efficiently down converts it to low voltage/high current needed to recharge the battery bank. If you measure Ibatt current >> Ipanel current, then you have a working MPPT charge controller (assuming Vmp-array~35 volts and Vcharge-batt~14.5 volts or less).

how to check the performance of an MPPT charge controller ...

The MPPT charge controller refers to the "Maximum Power Point Tracking" solar charge controller, which is an up-gradation of the traditional solar panel charge controller. The MPPT solar charge controller detects the solar panel voltage and current in real-time and constantly tracks for maximum power (P=U*I) so that the system always charges the battery with maximum power.

MPPT Charge Controller | Best Guide & Buying Tips of 2020

MPPT or "maximum power point tracking" controllers are far more advanced than PWM controllers and enable the solar panel to operate at its optimum voltage for maximum power output. Using this clever technology, MPPT solar charge controllers can be up to 30% more efficient, depending on the battery voltage and type of solar panel connected.

MPPT Solar Charge Controllers Explained — Clean Energy Reviews

What is MPPT? MPPT stands for Maximum Power Point Tracking. MPPT charge controllers used for extracting maximum available power from the PV module under certain conditions. Look at the image shown above. We have seen that the maximum power point (MPP) of a solar panel lies at the knee of the current and voltage curve.
