Measuring a Region.
When a planimeter is used to measure a region, the user moves the right endpoint of the rod, the tracing point, around the

boundary of the region to be measured.

Consequently the desired area is A_R . For a linear planimeter, the left endpoint moves back and forth along a line, enclosing no area, and so $A_L = 0$.

The planimeter is placed over top of the diagram in question and the user traces it with the stylus at the end of the short arm of the instrument. The planimeter measures the area of the traced figure. This is a polar planimeter because the

Connected to the arm ME is the measuring wheel with its axis of rotation parallel to ME. A movement of the arm ME can be decomposed into a movement perpendicular to ME, causing the wheel to rotate, and a movement parallel to ME, causing the wheel to skid, with no contribution to its reading.
