Discussion and Conclusion: The technique recrystallization was used because it is a simple method to purify a solid compound. The percentage yield for benzoic acid and acetanilide acid being high indicated the initial sample had a low concentration of impurities.

Discussion From this experiment, the percentage of recovered benzoic acid was 113.5% and 0.27g extra benzoic acid was obtained. The more than 100% of recovered benzoic acid obtained may due to several factors. It may contaminated with other impurities during the process of recrystallization.

One Part of Chemistry: Recrystallization

In this experiment a technique was used that will be used frequently throughout the semester: Purification by recrystallization. This technique allows for the purification of a crude material.
